This article explains how to configure Response Caching Middleware in an ASP.NET Core app. The middleware determines when responses are cacheable, stores responses, and serves responses from cache. For an introduction to HTTP caching and the [\[ResponseCache\]](#) attribute, see [Response Caching](#).

[View or download sample code](#) ([how to download](#))

Configuration

Response Caching Middleware is implicitly available for ASP.NET Core apps via the shared framework.

In `Startup.ConfigureServices`, add the Response Caching Middleware to the service collection:

C#

 Copy

```
public void ConfigureServices(IServiceCollection services)
{
    services.AddResponseCaching();
    services.AddRazorPages();
}
```

Configure the app to use the middleware with the [UseResponseCaching](#) extension method, which adds the middleware to the request processing pipeline in `Startup.Configure`:

C#

 Copy

```
public void Configure(IApplicationBuilder app, IWebHostEnvironment env)
{
    if (env.IsDevelopment())
    {
        app.UseDeveloperExceptionPage();
    }
    else
    {
        app.UseExceptionHandler("/Error");
    }

    app.UseStaticFiles();
    app.UseRouting();
    // UseCors must be called before UseResponseCaching
    // app.UseCors("myAllowSpecificOrigins");

    app.UseResponseCaching();

    app.Use(async (context, next) =>
    {
        context.Response.GetTypedHeaders().CacheControl =
            new Microsoft.Net.Http.Headers.CacheControlHeaderValue()
            {
                Public = true,
                MaxAge = TimeSpan.FromSeconds(10)
            };
        context.Response.Headers[Microsoft.Net.Http.Headers.HeaderNames.Vary] =
            new string[] { "Accept-Encoding" };

        await next();
    });

    app.UseEndpoints(endpoints =>
    {
        endpoints.MapRazorPages();
    });
}
```

Warning

UseCors must be called before **UseResponseCaching** when using **CORS middleware**.

The sample app adds headers to control caching on subsequent requests:

- **Cache-Control** : Caches cacheable responses for up to 10 seconds.
- **Vary** : Configures the middleware to serve a cached response only if the **Accept-Encoding** header of subsequent requests matches that of the original request.

C#

 Copy

```
// using Microsoft.AspNetCore.Http;

app.Use(async (context, next) =>
{
    context.Response.GetTypedHeaders().CacheControl =
        new Microsoft.Net.Http.Headers.CacheControlHeaderValue()
        {
            Public = true,
            MaxAge = TimeSpan.FromSeconds(10)
        };
    context.Response.Headers[Microsoft.Net.Http.Headers.HeaderNames.Vary] =
        new string[] { "Accept-Encoding" };

    await next();
});
```

The preceding headers are not written to the response and are overridden when a controller, action, or Razor Page:

- Has a **[ResponseCache]** attribute. This applies even if a property isn't set. For example, omitting the **VaryByHeader** property will cause the corresponding header to be removed from the response.

Response Caching Middleware only caches server responses that result in a 200 (OK) status code. Any other responses, including **error pages**, are ignored by the middleware.

Warning

Responses containing content for authenticated clients must be marked as not cacheable to prevent the middleware from storing and serving those responses. See **Conditions for caching** for details on how the middleware determines if a response is cacheable.

Options

Response caching options are shown in the following table.

Option	Description
MaximumBodySize	The largest cacheable size for the response body in bytes. The default value is $64 * 1024 * 1024$ (64 MB).
SizeLimit	The size limit for the response cache middleware in bytes. The default value is $100 * 1024 * 1024$ (100 MB).
UseCaseSensitivePaths	Determines if responses are cached on case-sensitive paths. The default value is <code>false</code> .

The following example configures the middleware to:

- Cache responses with a body size smaller than or equal to 1,024 bytes.
- Store the responses by case-sensitive paths. For example, `/page1` and `/Page1` are stored separately.

C#	 Copy
<pre>services.AddResponseCaching(options => { options.MaximumBodySize = 1024; options.UseCaseSensitivePaths = true; });</pre>	

VaryByQueryKeys

When using MVC / web API controllers or Razor Pages page models, the [\[ResponseCache\]](#) attribute specifies the parameters necessary for setting the appropriate headers for response caching. The only parameter of the `[ResponseCache]` attribute that strictly requires the middleware is [VaryByQueryKeys](#), which doesn't correspond to an actual HTTP header. For more information, see [Response caching in ASP.NET Core](#).

When not using the `[ResponseCache]` attribute, response caching can be varied with `VaryByQueryKeys`. Use the [ResponseCachingFeature](#) directly from the [HttpContext.Features](#):

C#	 Copy
<pre>var responseCachingFeature = context.HttpContext.Features.Get<IResponseCachingFeature>(); if (responseCachingFeature != null)</pre>	

```
{  
    responseCachingFeature.VaryByQueryKeys = new[] { "MyKey" };  
}
```

Using a single value equal to `*` in `VaryByQueryKeys` varies the cache by all request query parameters.

HTTP headers used by Response Caching Middleware

The following table provides information on HTTP headers that affect response caching.

Header	Details
Authorization	The response isn't cached if the header exists.
Cache-Control	<p>The middleware only considers caching responses marked with the <code>public</code> cache directive. Control caching with the following parameters:</p> <ul style="list-style-type: none">• <code>max-age</code>• <code>max-stale</code>[†]• <code>min-fresh</code>• <code>must-revalidate</code>• <code>no-cache</code>• <code>no-store</code>• <code>only-if-cached</code>• <code>private</code>• <code>public</code>• <code>s-maxage</code>• <code>proxy-revalidate</code>[‡] <p>[†]If no limit is specified to <code>max-stale</code>, the middleware takes no action.</p> <p>[‡]<code>proxy-revalidate</code> has the same effect as <code>must-revalidate</code>.</p> <p>For more information, see RFC 7231: Request Cache-Control Directives.</p>
Pragma	A <code>Pragma: no-cache</code> header in the request produces the same effect as <code>Cache-Control: no-cache</code> . This header is overridden by the relevant directives in the <code>Cache-Control</code> header, if present. Considered for backward compatibility with HTTP/1.0.

Header	Details
Set-Cookie	The response isn't cached if the header exists. Any middleware in the request processing pipeline that sets one or more cookies prevents the Response Caching Middleware from caching the response (for example, the cookie-based TempData provider).
Vary	The vary header is used to vary the cached response by another header. For example, cache responses by encoding by including the Vary: Accept-Encoding header, which caches responses for requests with headers Accept-Encoding: gzip and Accept-Encoding: text/plain separately. A response with a header value of * is never stored.
Expires	A response deemed stale by this header isn't stored or retrieved unless overridden by other Cache-Control headers.
If-None-Match	The full response is served from cache if the value isn't * and the ETag of the response doesn't match any of the values provided. Otherwise, a 304 (Not Modified) response is served.
If-Modified-Since	If the If-None-Match header isn't present, a full response is served from cache if the cached response date is newer than the value provided. Otherwise, a 304 - Not Modified response is served.
Date	When serving from cache, the Date header is set by the middleware if it wasn't provided on the original response.
Content-Length	When serving from cache, the Content-Length header is set by the middleware if it wasn't provided on the original response.
Age	The Age header sent in the original response is ignored. The middleware computes a new value when serving a cached response.

Caching respects request Cache-Control directives

The middleware respects the rules of the [HTTP 1.1 Caching specification](#) . The rules require a cache to honor a valid Cache-Control header sent by the client. Under the specification, a client can make requests with a no-cache header value and force the server to generate a new response for every request. Currently, there's no developer control over

this caching behavior when using the middleware because the middleware adheres to the official caching specification.

For more control over caching behavior, explore other caching features of ASP.NET Core. See the following topics:

- [Cache in-memory in ASP.NET Core](#)
- [Distributed caching in ASP.NET Core](#)
- [Cache Tag Helper in ASP.NET Core MVC](#)
- [Distributed Cache Tag Helper in ASP.NET Core](#)

Troubleshooting

If caching behavior isn't as expected, confirm that responses are cacheable and capable of being served from the cache. Examine the request's incoming headers and the response's outgoing headers. Enable [logging](#) to help with debugging.

When testing and troubleshooting caching behavior, a browser may set request headers that affect caching in undesirable ways. For example, a browser may set the `Cache-Control` header to `no-cache` or `max-age=0` when refreshing a page. The following tools can explicitly set request headers and are preferred for testing caching:

- [Fiddler](#)
- [Postman](#)

Conditions for caching

- The request must result in a server response with a 200 (OK) status code.
- The request method must be GET or HEAD.
- In `Startup.Configure`, Response Caching Middleware must be placed before middleware that require caching. For more information, see [ASP.NET Core Middleware](#).
- The `Authorization` header must not be present.
- `Cache-Control` header parameters must be valid, and the response must be marked `public` and not marked `private`.
- The `Pragma: no-cache` header must not be present if the `Cache-Control` header isn't present, as the `Cache-Control` header overrides the `Pragma` header when present.
- The `Set-Cookie` header must not be present.
- `Vary` header parameters must be valid and not equal to `*`.

- The Content-Length header value (if set) must match the size of the response body.
- The [IHttpSendFileFeature](#) isn't used.
- The response must not be stale as specified by the Expires header and the max-age and s-maxage cache directives.
- Response buffering must be successful. The size of the response must be smaller than the configured or default [SizeLimit](#). The body size of the response must be smaller than the configured or default [MaximumBodySize](#).
- The response must be cacheable according to the [RFC 7234](#) specifications. For example, the no-store directive must not exist in request or response header fields. See *Section 3: Storing Responses in Caches* of [RFC 7234](#) for details.

ⓘ Note

The Antiforgery system for generating secure tokens to prevent Cross-Site Request Forgery (CSRF) attacks sets the Cache-Control and Pragma headers to no-cache so that responses aren't cached. For information on how to disable antiforgery tokens for HTML form elements, see [Prevent Cross-Site Request Forgery \(XSRF/CSRF\) attacks in ASP.NET Core](#).
